

Mathematics III  
Part II (Hons)

Concept of a Subgroup and cyclic group.

Subgroup: — Let  $(G, \circ)$  be a group and  $H$  is a non-empty subset of  $G$ . Then  $H$  is said to be Subgroup of  $G$  iff  $H$  is a group itself under the group operation  $\circ$  of  $G$ .

i.e. the group  $(H, \circ)$  is a Subgroup of the group  $(G, \circ)$  if  $H \subseteq G$  and  $H$  is non empty.

i.e. The set  $C$  of Complex numbers is a group under addition. The set  $R$  of Real numbers is a subset of  $C$  and is a group under addition. So  $R$  is a Subgroup of  $C$ .

i.e. the set of real numbers is a Subgroup of the additive group of Complex numbers.

Cyclic group: — A group  $(G, \circ)$  is said to be a cyclic group if there exists an element  $a \in G$  such that every element  $b$  of  $G$  can be expressed as an integral power  $a^n$  of  $a$  for some integer  $n$ . The set  $\{a\}$  is called a generator of cyclic group i.e.  $a$  is generator of  $G$ . It is denoted by  $\langle a \rangle$ .

i.e. (1) The set  $G = \{1, \omega, \omega^2\}$  i.e. Cube roots of unity is a cyclic group under multiplication of Complex number.

This is because we can write

$$G = \{\omega^3, \omega^1, \omega^2\}$$

i.e.  $G$  is an integral power of  $\omega \in G$ .

Theorem: — Prove that a non-empty subset  $H$  of the group  $G$  under the operation ' $\circ$ ' forms a Subgroup of  $G$  iff  $a \cdot b \in H \Rightarrow a b^{-1} \in H$ .

Proof: — Necessary condition: — let  $H$  be a Subgroup

of the group  $G$ . Then we have to prove that  
 $a \in H, b \in H \Rightarrow ab^{-1} \in H$

Given that  $H$  is a group and  $b \in H$  then  $b^{-1} \in H$ .  
We have  $a \in H, b^{-1} \in H$  then by closure law  
 $ab^{-1} \in H$ .

So the condition is necessary.

Sufficient condition: Let  $a \in H, b \in H \Rightarrow ab^{-1} \in H$   
Then we have to prove that  $H$  is a subgroup  
of the group  $G$ .

(i) Existence of identity:  $a \in H, a \in H$   
 $\Rightarrow a a^{-1} \in H \Rightarrow e \in H$ . Where  $e$  is identity  
element of  $G$ .

So identity element exists in  $H$ .

(ii) Existence of Inverse:  $e \in H, a \in H \Rightarrow e a^{-1} \in H$   
Thus the inverse axiom is satisfied by  $H$ .

(iii) Closure law:  $a \in H, b \in H \Rightarrow a \in H, b^{-1} \in H$   
(as existence of inverse hold for  $H$  so  $b^{-1} \in H$ )  
 $\therefore a \in H, b \in H \Rightarrow a(b^{-1}) \in H$

$\Rightarrow aob \in H$   $\therefore$  closure law hold.

(iv) Associative law: Since  $G$  is a group then  
 $G$  must be associative  $H \subset G$  then  $H$  must  
also be associative. Hence  $H$  satisfies all the  
axioms of a group. But  $H \subset G$ .

So  $H$  is subgroup of a group  $G$ .

Proved.
