

## Mode

Mode is the value which occurs most frequently in a set of observations and around which the other items of the set cluster closely.

According to A.M. Tutte, 'Mode is the value which has the greatest frequency density in its immediate neighbourhood.'

In case of frequency distributions, mode is the value of the variable corresponding to the maximum frequency.

Example: Give mode value.

In case of continuous frequency distributions, the class corresponding to the maximum frequency is called the nodal class and the value of mode is obtained by following formula

$$\text{Mode} = l + \frac{h(f_1 - f_0)}{2f_1 - f_0 - f_2}$$

where,

$l \rightarrow$  lower limit of the nodal class

$f_1 \rightarrow$  frequency of the nodal class

$f_2 \rightarrow$  frequency of the class succeeding the nodal class

$f_0 \rightarrow$  frequency of the class preceding the nodal class

$h \rightarrow$  magnitude of the nodal class

Example

<u>X</u>	<u>f</u>
10-20	4
20-30	6
30-40	8
40-50	10
50-60	20

- \* The maximum frequency occurs either in the very beginning or at the end.
- \* If there are irregularities occurs either the modal class is located by the method of grouping method.

$$50-60 \rightarrow (f_0)$$

$$60-70 \rightarrow \text{Modal class } (f_1)$$

$$70-80 \rightarrow (f_2)$$

$$80-90 \rightarrow (f_3)$$

$$90-100 \rightarrow (f_4)$$

$$100-110 \rightarrow (f_5)$$

$$\begin{aligned} & \therefore 2f_1 - f_0 - f_2 = 0 \\ & = 2 \times 22 - 20 - 24 \\ & = 44 - 44 \\ & = 0. \end{aligned}$$

∴ Here, modal class identified by using grouping method.

- \* If the method of grouping gives the modal class which does not correspond to the maximum frequency, then we may get the situation of  $2f_1 - f_0 - f_2 = 0$ .

The formula will be:

$$\text{Mode} = l + \frac{h[f_1 - f_0]}{[f_1 - f_0] + [f_1 - f_2]}$$

$$M_o = 60 + \frac{10(22 - 20)}{|22 - 20| + |22 - 24|} \quad (\text{Using this formula})$$

$$= 60 + \frac{10 \times 2}{2+2}$$

$$\text{Hence, Mode} = 60 + 5 \\ = 65 \text{ (Ans)}$$

For Grouping Method:

<u>X</u>	<u>(1)</u>	<u>(2)</u>	<u>(3)</u>	<u>(4)</u>	<u>(5)</u>	<u>(6)</u>
1	3	{ 22	{ 31	{ 34	{ 38	{ 20
2	19	{ 16	{ 8	{ 11	{ 14	{ 16
3	12	{ 7	{ 10	{ 16	{ 13	{ 12
4	4	{ 7	{ 9	{ 11	{ 14	{ 16
5	3	{ 7	{ 9	{ 11	{ 14	{ 16
6	2	{ 7	{ 9	{ 11	{ 14	{ 16
7	7	{ 13	{ 9	{ 16	{ 13	{ 12
8	6	{ 7	{ 9	{ 11	{ 14	{ 16
9	3	{ 7	{ 9	{ 11	{ 14	{ 16
10	4	{ 7	{ 9	{ 11	{ 14	{ 16
11	5	{ 7	{ 9	{ 11	{ 14	{ 16
12	2	{ 7	{ 9	{ 11	{ 14	{ 16

	Maximum frequency	corresponding $X$ values to the maximum frequency
(1)	19	(2) 19 20 21
(2)	22	(1) 22 23 24
(3)	31	(2) 2 3 (3) 4 5 6
(4)	34	(1) 1 (2) 3 4 (3) 5 6 7
(5)	35	(2) 1 (3) 2 3 4 5
(6)	20	(1) 1 (2) 2 (3) 4 5 6

Attending piezoelectric border with 51.  
maximum frequency for each border not to be  
more than 5 times. Hence mode is (2) 2.

Value 2 is repeated maximum  
frequency for each border not to be  
more than 5 times. Hence mode is (2) 2.

### Merits

(1) Easy to calculate and understand.

(2) Not affected by extreme values.

(3) Also can be used in open ended class.

### Demerits

(1) Not based on all the observations of the series.

(2) Not suitable for further mathematical treatment.

(3) Affected by the fluctuations of sampling.
